Streamlining Ticket Assignment for Efficient Support Operations

Problem Statement

In many organizations, support tickets are handled manually, where service desk agents assign tickets to support teams based on their understanding. This manual process often leads to delays, incorrect assignment, and uneven workload distribution among team members. High-priority tickets may not be addressed quickly, and there is a lack of proper tracking and automation in ticket handling.

To overcome these challenges, there is a need to develop an automated system that streamlines ticket assignment by intelligently routing tickets to the appropriate support groups and agents based on predefined rules such as category, priority, and availability. This system should improve efficiency, reduce response time, and enhance overall support operations.

Users

Objective:

Define and manage users involved in the ticketing system.

Description:

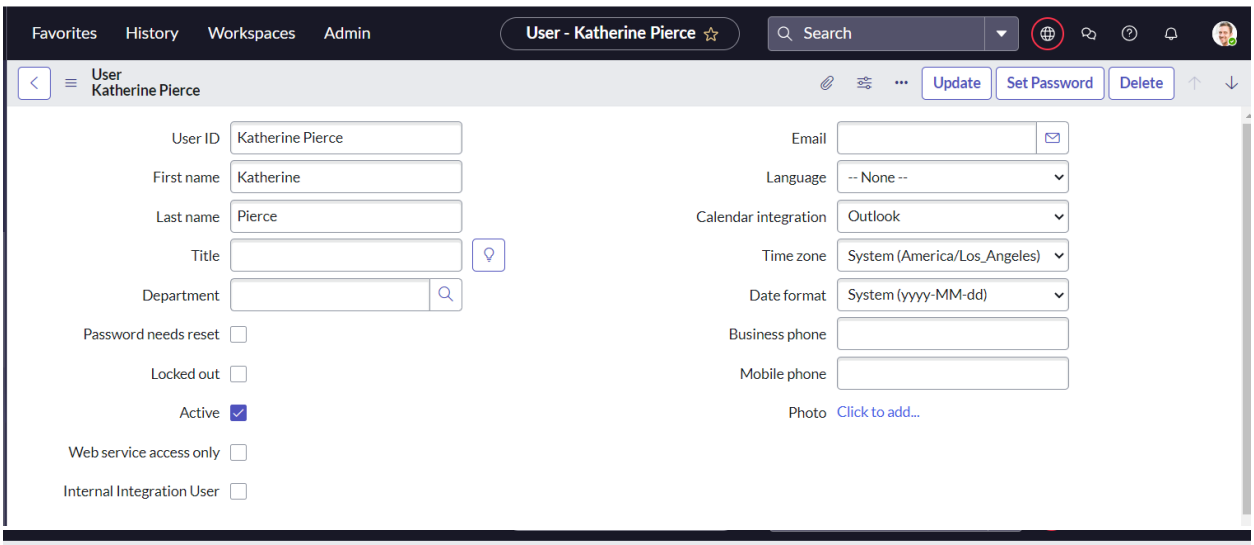
Users are individuals who interact with the system. They can create, view, and resolve tickets based on their roles.

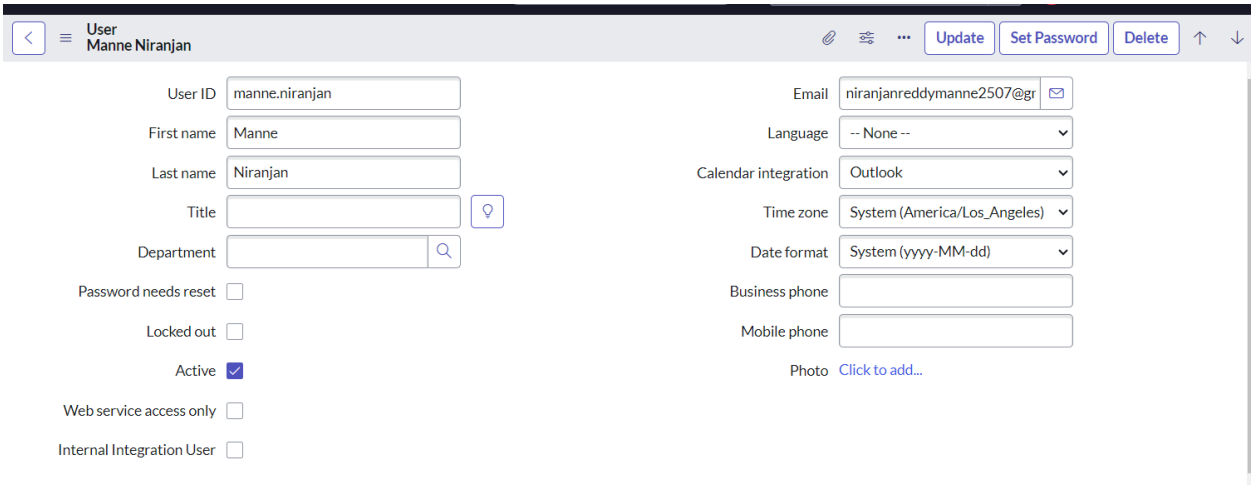
Types of Users:

- End Users (Raise tickets)
- Support Agents (Resolve tickets)
- Admins (Manage system)

Procedure:

- Navigate to User Administration → Users
- Click New
- Enter user details (Name, Email, Role)
- Save the record





Groups

Objective:

Organize users into groups for efficient ticket assignment.

Description:

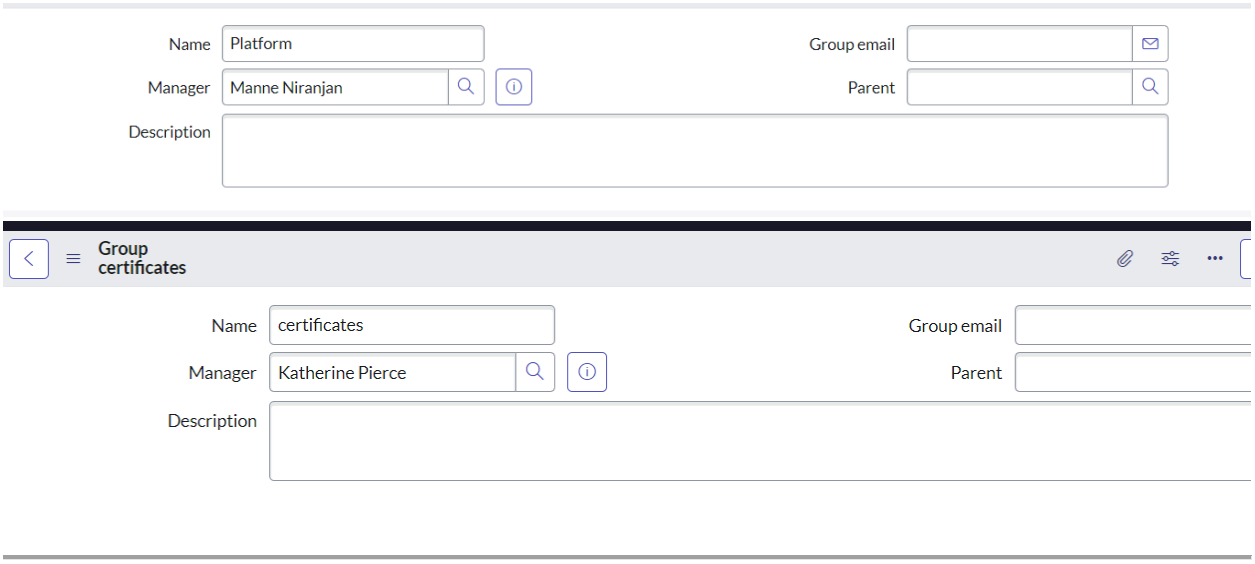
Groups represent teams such as Network, Software, or Hardware support.

Examples:

- Network Support Team
- Software Support Team
- Help Desk Team

Procedure:

- Go to User Administration → Groups
- Click New
- Enter group name
- Add users to the group
- Save



Roles

Objective:

Control access permissions for users.

Description:

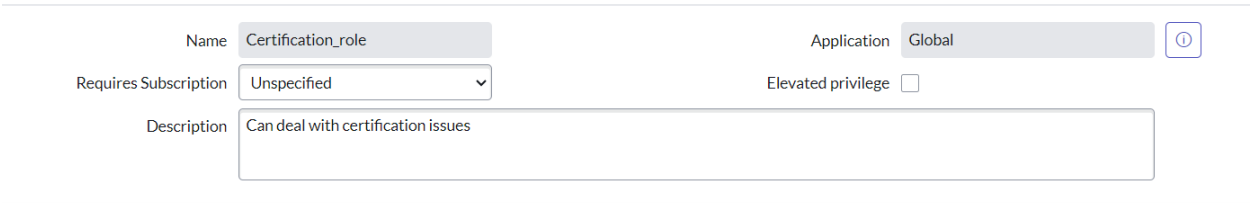
Roles define what actions a user can perform in the system.

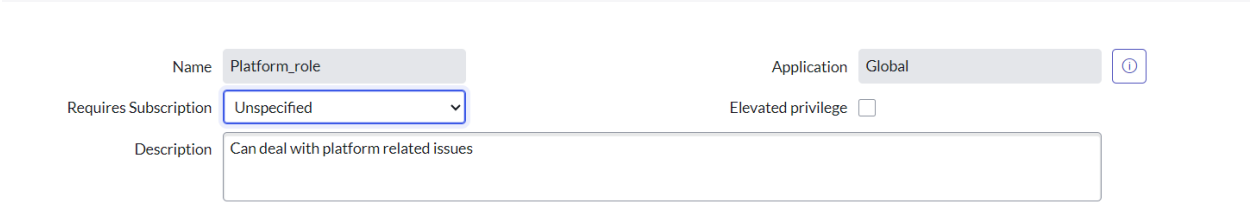
Examples:

- itil (IT support role)
- admin (Full access)
- user (Basic access)

Procedure:

- Navigate to User Administration → Roles
- Click New
- Define role name
- Assign permissions
- Save





Table

Objective:

Store ticket (incident) data.

Description:

The Incident Table holds all ticket information such as:

- Ticket ID
- Description
- Priority
- Assignment Group
- Assigned To

Procedure:

- Go to System Definition → Tables
- Create or use Incident table
- Add required fields
- Save

	Column label	Type	Reference	Max length	Default value	Display
	Created by	String	(empty)	40		false
	Created	Date/Time	(empty)	40		false
	Sys ID	Sys ID (GUID)	(empty)	32		false
	Updates	Integer	(empty)	40		false
	Updated by	String	(empty)	40		false
	Updated	Date/Time	(empty)	40		false
×	Assigned to group	Reference	Group	40		false
×	Assigned to user	Reference	User	32		false
×	Comment	String	(empty)	40		false
×	Issue	String	(empty)	40		false
×	Name	String	(empty)	40		false
×	Priority	String	(empty)	40		false
×	Service request No	String	(empty)	40	javascript:getNextObjNumberPadded();	false
×	Ticket raised Date	Date/Time	(empty)	40		false
+	*Insert a new row...*					

Assign Roles & Users to Groups

Objective:

Link users and roles with groups.

Description:

Users must belong to groups to receive tickets, and roles define their permissions.

Procedure:

- Open a Group
- Go to Group Members
- Add users
- Assign roles if required
- Save

Assign Role to Table

Objective:

Restrict table access using roles.

Description:

Only authorized users can access or modify ticket data.

Procedure:

- Open Table settings
- Go to Access Controls
- Assign role (e.g., itil)
- Save

Create ACL (Access Control List)

Objective:

Ensure secure access to ticket data.

Description:

ACL defines:

- Who can read
- Who can write
- Who can delete

Procedure:

- Go to System Security → ACL
- Click New
- Select table (Incident)
- Define role and permissions
- Save

Flow

Objective:

Automate ticket assignment process.

Description:

Flow Designer automates routing of tickets.

Flow Steps:

1. Ticket is created
2. Check category
3. Assign to group
4. Assign to agent
5. Notify user

Example Logic:

- If Category = Network → Assign Network Team
- If Priority = High → Assign Senior Agent

Procedure:

- Go to Flow Designer
- Create new flow
- Add trigger (Ticket Created)
- Add conditions
- Add assignment action
- Save & Activate

Conclusion

This project successfully automates ticket assignment using ServiceNow features like Users, Groups, Roles, ACL, and Flow Designer. It reduces manual effort, improves efficiency, and ensures tickets are assigned quickly and accurately to the right support teams.
